Scalability & Future Plan

Date	01 October 2026
Team ID	6ab22569f32d8c9d8b2254f2
Project Name	Auto Ticket Classification using Flow Designer
Maximum Marks	1 Mark

Scalability & Future Plan:

This document outlines how the current project solution, Auto Ticket Classification using Flow Designer, can be scaled to handle larger user bases, increased data loads, or extended features in the future. It also captures the team's roadmap for enhancing and evolving the project beyond its current state.

Current System Limitations:

S.No	Limitation	Impact	Priority to Address (High / Medium / Low)
1	Classification relies on keyword/condition rules in Flow Designer, so it cannot understand context or new wording in tickets.	Ambiguous or misspelled tickets get wrong category/priority and need manual reassignment, delaying resolution.	High
2	Rules are maintained manually; every new category, service or assignment group needs a flow change.	Higher maintenance effort and risk of outdated or conflicting rules as ticket volume and types grow.	Medium
3	Synchronous flows run on each ticket insert/update with no bulk-handling, retry or error-monitoring dashboard.	During peak load, processing can lag and failed flow executions may go unnoticed.	High

Scalability Plan:

S.No	Scalability Aspect	Current State	Proposed Upgrade / Solution
1	User Load	Handles the current volume of tickets raised by a limited set of users through a single flow trigger.	Move heavy steps to asynchronous/scheduled flows, use subflows for reuse, and rely on ServiceNow's multi-node instance scaling to support more users and concurrent tickets.
2	Data Storage	Tickets and classification results are stored in the standard Incident table with no archiving.	Enable data archiving and table rotation for old tickets, add indexes on category/assignment fields, and keep classification logs in a separate custom table.
3	Performance	Rule-based conditions are evaluated sequentially on every ticket, which adds processing time as rules grow.	Optimise and consolidate conditions, reduce redundant lookups, and use Predictive Intelligence / ML-based classification; monitor flows with Flow Execution reports and Performance Analytics.
4	Security	Access controlled by basic roles and ACLs on tickets and flows.	Apply least-privilege role-based access, restrict flow editing to admins, enable audit logging, protect sensitive ticket data (field encryption/data masking) and use OAuth for integrations.

Future Roadmap:

Phase	Planned Feature / Enhancement	Target Timeline	Expected Impact
Phase 1	Current release: rule-based auto classification and assignment using Flow Designer.	Completed	Reduces manual triage and speeds up ticket routing.
Phase 2	Add fallback handling, error notifications and a flow-monitoring dashboard; refine rules using ticket history.	1–2 months	Higher accuracy and fewer unnoticed failures.
Phase 3	Integrate ML-based classification (Predictive Intelligence) with confidence thresholds and auto-priority suggestions.	3–4 months	Smarter, context-aware classification with less rule maintenance.
Phase 4	Extend to HR/CSM tickets and a Virtual Agent / email intake; add SLA-breach alerts and analytics dashboards.	5–6 months	Wider coverage, faster resolution and better SLA compliance.
