Project Name	Auto Ticket Classification using Flow Designer
Maximum Marks	5 Marks

Coding & Solution

This section evaluates the quality and completeness of your implemented code and the overall solution. Your submission should demonstrate working functionality, clean code practices, and alignment with your defined requirements.

Instructions:

1. Ensure your code is well-structured, commented, and follows best practices for your chosen technology stack.
2. The solution should address the core problem statement and implement the key functional requirements.
3. Include all source files, configuration files, and setup instructions needed to run the application.
4. Attach or link to your code repository (e.g., GitHub) in the table below.

Solution Summary

Field	Details
Repository Link / URL	[Paste your GitHub / GitLab or hosted link here]
Programming Language(s)	ServiceNow Flow Designer (low-code); JavaScript for script steps
Framework(s) Used	ServiceNow platform, Flow Designer, Decision Tables, Email Notifications
Key Features Implemented	- Flow triggers when an incident is created or updated. - Keyword-based classification sets category and subcategory. - Assignment group and priority are set automatically from a decision table. - Unmatched tickets go to a default triage queue. - Assignee and caller are notified after classification. - Reports track auto-classified vs manual tickets.
Pending / Incomplete Features	- Predictive Intelligence (ML) classification. - Virtual Agent ticket intake and knowledge article suggestions. - Load-based assignment to individual agents.
Setup / Run Instructions	1. Log in to your ServiceNow Personal Developer Instance. 2. Import the update set containing the flow, subflows and decision table, then commit it. 3. Open Flow Designer and activate the flow "Auto Classify Incident". 4. Add or edit keyword rules in the Decision Table if needed. 5. Create a test incident (e.g., short description "VPN not working") and check that the category and assignment group are set. 6. Review results in Flow Designer > Executions.

Code Quality Checklist

S.No	Criteria	Status (Yes / No)
1	Code is modular and organized into functions / classes	Yes
2	Meaningful variable and function names are used	Yes
3	Code includes comments / documentation where necessary	Yes
4	Error handling is implemented for critical operations	Yes
5	The application runs without critical errors	Yes
6	Code is committed to a version control repository	Yes

Additional Notes / Comments:

The solution uses low-code Flow Designer, so most logic is configured as flow steps and a decision table rather than written code.
Keyword rules can be updated by admins without editing the flow.
Further improvements: add Predictive Intelligence and more detailed comments on the decision table rules.
