Solution Requirements

Date	01 October 2026
Team ID	6ab22569f32d8c9d8b2254f2
Project Name	Auto Ticket Classification using Flow Designer
Maximum Marks	4 Marks

Define Functional and Non-Functional Requirements:

Create a comprehensive list of requirements to define exactly what your solution will do and how well it will perform.

- **Functional Requirements (FR)** define specific behaviors, functions, or features of the system (What the system should *do*).
- **Non-Functional Requirements (NFR)** specify the criteria that judge the operation of a system, rather than specific behaviors (How the system should *be*).

Fill out the descriptions and necessary details for each category provided below.

Step 1: Functional Requirements (FR)

S.No	Requirement Category	Requirement Description	Priority (High/Medium/Low)
1	Authentication	Users sign in to the ServiceNow instance with their organisation credentials (SSO or username/password, with MFA where enabled). The Flow Designer flow itself runs under a system / integration user, so no extra login is needed to classify tickets.	High
2	Authorization levels	End User: create and view own tickets. Service Desk Agent: view and update tickets and correct the category if needed. Resolver (assignment group member): work on assigned tickets. Flow / ServiceNow Admin: build and maintain the flow and classification rules.	High
3	External interfaces	Uses ServiceNow's built-in email notification and Service Portal. No third-party APIs are required for the first release; Teams / Slack or Virtual Agent integration can be added later.	Medium
4	Transactions processing	A flow is triggered when an incident is created or its short description changes. It reads the short description / description, matches keywords, and uses Update Record to set category, subcategory, priority and assignment group. Each run is logged in Flow execution history.	High
5	Reporting	Reports and a dashboard showing auto-classified vs manually classified tickets, tickets by category and group, misrouted / reassigned tickets, SLA compliance, and flow execution status.	Medium

S.No	Requirement Category	Requirement Description	Priority (High/Medium/Low)
6	Business rules, etc.	Keyword-to-category-to-group rules are kept in a decision table. Priority is raised for words such as outage or down. Tickets with no match go to a default triage group. A category set manually by an agent is not overwritten. VIP / critical-service tickets can be escalated.	High
7	Compliance to laws or regulations	Follow the organisation's ITSM and data privacy policies (e.g., GDPR / ISO 27001 where applicable). Access is controlled with roles and ACLs, ticket data is not sent outside the platform, and changes to the flow are auditable.	Medium
8	Other	Notify the assignment group and the caller after classification. Allow the flow to be enabled / disabled easily. Test the flow with sample tickets in a developer instance before deployment.	Medium

Step 2: Non-Functional Requirements (NFR)

S.No	NFR Category	Requirement Description	Target Metric / Acceptance Criteria
1	Performance & Speed	Classification and assignment run automatically in the background without slowing down ticket submission.	Ticket classified and assigned within 10 seconds of creation
2	Scalability	Handles growth in ticket volume and in the number of keyword rules without redesigning the flow.	1,000+ tickets per day; new rules added in the decision table without editing the flow
3	Security & Data Privacy	Role-based access and ACLs control who can view tickets or edit the flow and rules. The flow runs with least privilege and notifications avoid sensitive details.	Only authorised roles can change the flow; all changes tracked in audit history
4	Reliability & Availability	If no rule matches or the flow fails, the ticket falls back to the default queue and the error is logged so no ticket is lost.	99.9% availability (platform uptime); 0 tickets left unassigned
5	Usability & Accessibility	Users submit tickets exactly as before. Admins maintain rules through a simple table. Uses the standard ServiceNow interface.	Complies with WCAG 2.1 AA as provided by ServiceNow UI
6	Other (Maintainability, Accuracy)	The flow is built from clear, documented steps so it is easy to update. Classification should be accurate enough to reduce manual rework.	New keyword rule added in under 5 minutes; 85% or more tickets correctly classified
